LAB WORKSHEET

Active Directory Lab

Administer a Windows domain: OUs, users and groups, share and NTFS permissions, and Group Policy.

Key ideas

- **OUs** organise users and computers so you can delegate and link Group Policy.
- **AGDLP**: Accounts → Global groups → Domain Local groups → Permissions.
- **Share + NTFS**: the most restrictive of the two wins; an explicit **Deny** beats Allow.
- Group Policy order **LSDOU**: Local, Site, Domain, OU — the last applied wins, unless a link is **Enforced**; **Block Inheritance** stops parent GPOs (except Enforced ones).

Tools

- **Active Directory Users and Computers**: New → Organizational Unit / User / Group; Properties → Member Of; Reset Password; Disable/Enable; Unlock.
- **Group Policy Management**: create and link a GPO, Enforced, Block Inheritance, Scope → Security Filtering; edit in the Group Policy Management Editor.
- Folder **Properties** → Sharing → Advanced Sharing → Permissions, and Security (NTFS) → Edit / Advanced / Effective Permissions.

Commands

```
whoami /groups      gpupdate /force      gpresult /r
net user j.smith /domain      net group      net use S: \\FS01\Sales
```

Guided steps

Log on to DC01 → OUs Staff → Sales and HR → users j.smith and a.khan → global groups GG_Sales / GG_HR → add users → domain local groups → nest (AGDLP) → share and NTFS permissions on FS01 → "Sales Desktop Lockdown" GPO linked to Sales → account lockout policy → log on to PC-SALES-01 as j.smith and check with gpresult → test S: and HR access → Control Panel blocked.
