LAB WORKSHEET

SOC / SIEM Lab

Work a SOC analyst shift in a Splunk-style SIEM: search logs, triage notable events, classify incidents and hand over.

Key SPL

```
index=web   sourcetype=linux_secure   "Failed password"   fail*   src_ip=198.51.100.77
status>=500
| stats count by src_ip | sort -count
| top limit=10 user            | rare user
| timechart span=1h count
| rex "for (invalid user )?(?<tried>\S+) from"
| eval MB=round(bytes_out/1024/1024,1) | where MB>100
| table _time host user        | dedup host
```

Using the interface

- The time picker really filters the events. Click a timeline bar to zoom in.
- **Fields sidebar:** click a field for its top values, then click a value to add it to your search.
- **Tabs:** Events, Statistics and Visualization (line, column, bar, pie and single value).
- **Save As:** Alert (with a trigger condition), Report or Dashboard panel.
- **Security app:** Security Posture, Incident Review (assign, change status, comment) and Investigations (classification, MITRE ATT&CK technique, IOCs, action).

Guided training

1. Run `index=*` over the last 24 hours.
2. Filter to `sourcetype=linux_secure`.
3. Search for `"Failed password"`.
4. Run `stats count by src_ip`.
5. Name the brute-force IP.
6. Draw a timechart line chart.
7. Use rex to list the user names tried.
8. Find the successful login.
9. Assign the notable to yourself.
10. Investigate it.
11. Save an alert, then press Simulate next hour.
12. Add a panel to your dashboard.

Independent shift

Triage six notables: phishing → PowerShell → beaconing, SQL injection, a rogue admin account, data exfiltration, an authorised scan, and a password lockout. Classify each as a true positive, false positive or benign true positive, map it to ATT&CK, then end the shift and copy your handover note.

Classifications: a **true positive** is real malicious activity. A **false positive** is an alert on activity that isn't malicious (e.g. an authorised scan). A **benign true positive** is a correct alert on harmless activity (e.g. a user locked out after a password

change).
