QUIZ WORKSHEET

Network Components Quiz

Recognise the topology symbols for common network devices and know what each one does.

How the quiz works

1. Each card shows a topology symbol. Choose the component's **name** from the list (some names are distractors).
2. **Drag** the matching definition onto the card. On a touchscreen, tap a definition, then tap the card.
3. Press **Check answers**: one mark per correct name and one per correct definition. Wrong cards show the correction and the OSI layer.
4. Use **Study cards** to revise, and **All 12** for the full set.

The components

Component	Layer	What it does
Router	3	joins different networks; forwards packets using IP addresses and a routing table
Switch	2	forwards frames within a LAN only to the port of the destination MAC
Multilayer switch	2 & 3	a switch that can also route between VLANs/subnets
Hub	1	repeats every signal out of every port — one shared collision domain
Firewall	3–7	permits or blocks traffic between zones using security rules
Wireless access point	1 & 2	connects Wi-Fi devices to the wired LAN
Server	end device	provides services (web, files, email, DHCP, DNS) to clients
PC	end device	fixed desktop device, usually wired
Laptop	end device	portable device, usually on Wi-Fi
IP phone	end device	voice calls as data packets (VoIP), often PoE-powered
Network printer	end device	shared printer with its own IP address
Cloud / Internet	WAN	networks outside your control, reached through an ISP

Exam tip: hub vs switch vs router is a favourite question. Hub = repeats to all (Layer 1). Switch = MAC addresses, one LAN (Layer 2). Router = IP addresses, between networks (Layer 3).
